

The Northumberland Barn Owl box (4) -

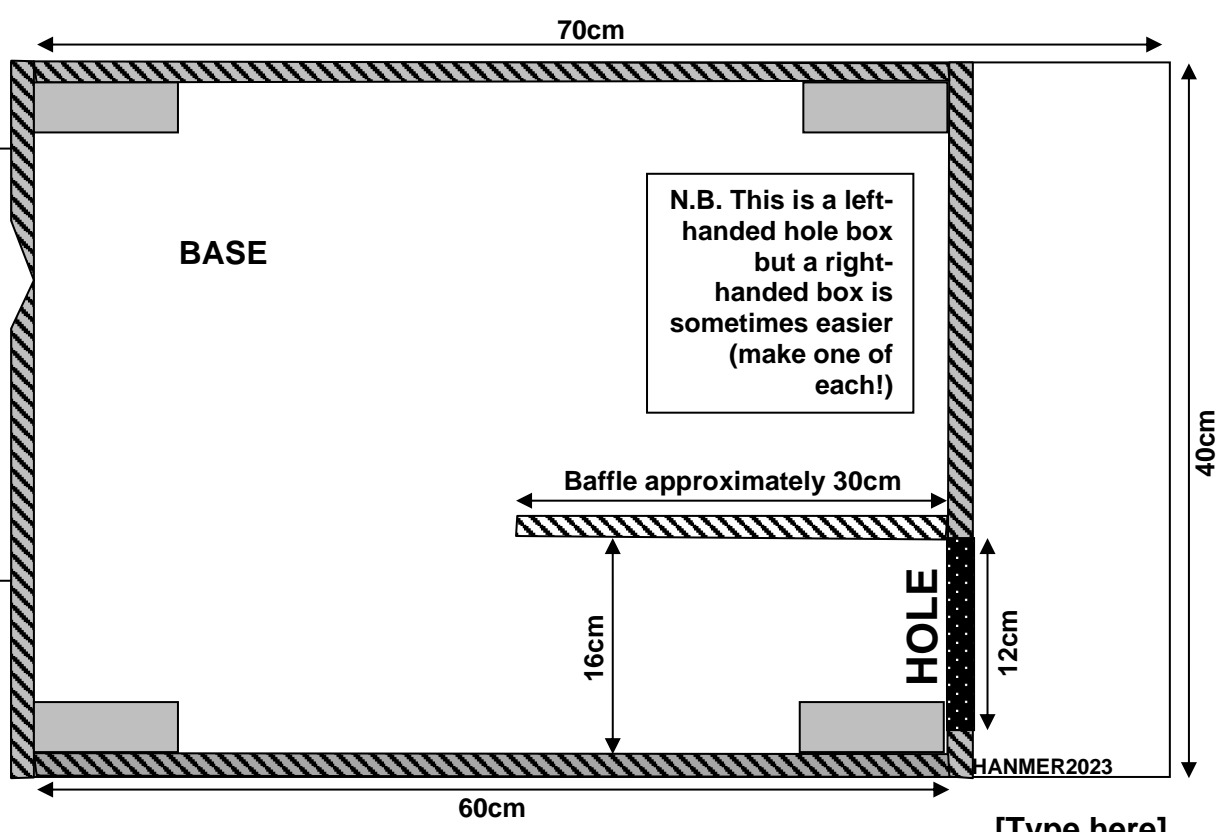

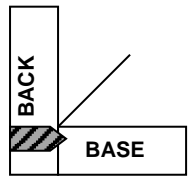

Wooden blocks screwed into the corners of the box. These give the structure rigidity and provide purchase points for screwing down the lid etc.

Screw lid down from the top into the corner blocks.

The side & front rest on the base. The back screws into the base

N.B. This is a left-handed hole box but a right-handed box is sometimes easier (make one of each!)

[Type here]

Use 18mm exterior quality ply (or something similar); paint outside only, with water-based fence type paint. You can waterproof the roof lid more, with a coat of exterior gloss paint or cover with roofing felt. Place in a barn or in a tree; about 2.5 meters up. It does not need to be any higher. (Don't hide in a wood.) The most successful boxes are in disused (or quiet) buildings. Never place high up in the inside peak of a roof – you will just get pigeons! An owl likes to see its way clearly in and out. (Can be put on a 2.0m square post).
